

Technical Information: Litestructures Bandstand

The Bandstand is a fixed hexagonal construction, with a truss grid supported by eight masts. The structure is constructed from Litestructures Astralite 3 Truss, with a combination of standard lengths and custom corners. The structure can be used in two main configurations; with an integral base, or built on an extended base. The standard format has a footprint of 6.7m by 6.7m, whilst the extended version measures 9.8m by 9.8m

The stage has a central apex height of 5.4m, with a maximum height to grid of 4.2m. Although the structure can support a small amount of lighting, it is not really designed for large loads.

The roof of the stage is covered in a blue and green PVC material. The standard stage base layout is 6.7m by 6.7m, with a platform height of 0.6m (2'), although as with all the stage platforms this can be built at a height to suit to situation. Handrails can be fitted to the sides of the platform as required, along with various ramp and step options for access.

The structure and all its components are all fully rated, tested and certified, and the construction is signed off by a suitably trained technician prior to handover. Full method statements and risk assessments are adhered to at all times.

The structure is secured to the ground using special anchors. In a situation where these cannot be used, it can also be secured to surface ballast containers. However, due to the design and size of the structure, the ballast weight required is minimal. The Bandstand can be installed by a trained team of IPS technicians in a couple of hours, and removal is marginally quicker.

This stage can be supplied as an individual item, or as part of a complete technical production solution. IPS can also supply crowd barrier, stage risers, viewing platforms, FOH control positions, sound systems, special effects, stage and event lighting equipment and much more. Please do not hesitate to contact us for further details.
